Patent Notices

SolidWorks® 3D mechanical CAD software is protected by U.S. Patents 5,815,154; 6,219,049; 6,219,055; 6,611,725; 6,844,877; 6,898,560; 6,906,712; 7,079,990; 7,477,262; 7,558,705; 7,571,079; 7,590,497; 7,643,027; 7,672,822; 7,688,318; 7,694,238; 7,853,940 ; and foreign patents, (e.g., EP 1,116,190 and JP 3,517,643).

eDrawings® software is protected by U.S. Patent 7,184,044; U.S. Patent 7,502,027; and Canadian Patent 2,318,706.

U.S. and foreign patents pending.

Trademarks and Product Names for SolidWorks Products and Services

SolidWorks, 3D PartStream.NET, 3D ContentCentral, eDrawings, and the eDrawings logo are registered trademarks and FeatureManager is a jointly owned registered trademark of DS SolidWorks.

CircuitWorks, Feature Palette, FloXpress, PhotoWorks, TolAnalyst, and XchangeWorks are trademarks of DS SolidWorks.

FeatureWorks is a registered trademark of Geometric Software Solutions Ltd.

SolidWorks 2011, SolidWorks Enterprise PDM, SolidWorks Simulation, SolidWorks Flow Simulation, and eDrawings Professional are product names of DS SolidWorks.

Other brand or product names are trademarks or registered trademarks of their respective holders.

COMMERCIAL COMPUTER SOFTWARE - PROPRIETARY

U.S. Government Restricted Rights. Use, duplication, or disclosure by the government is subject to restrictions as set forth in FAR 52.227-19 (Commercial Computer Software -Restricted Rights), DFARS 227.7202 (Commercial Computer Software and Commercial Computer Software Documentation), and in the license agreement, as applicable.

To the Instructor

This document introduces SolidWorks users to the SolidWorks Flow Simulation flow and heat transfer analyses software package. The specific goals of this lesson are to:

- 1 introduce the basic concepts of fluid flow analyses and their benefits
- 2 demonstrate the ease of use and the concise process for performing these analyses
- **3** introduce the basic rules for computational fluid dynamics analyses and how to obtain reliable and accurate results.

This document is structured similar to lessons in the SolidWorks Instructor Guide. This lesson has corresponding pages in the *SolidWorks Flow Simulation Student Workbook*.

Note: This lesson does not attempt to teach all capabilities of SolidWorks Flow Simulation. It only intends to introduce the basic concepts and rules of performing flow and heat transfer analyses and to show the ease of use and the concise process of doing so.

Education Edition Curriculum and Courseware DVD

An Education Edition Curriculum and Courseware DVD is provided with this course.

Installing the DVD creates a folder named SolidWorks Curriculum_and_Courseware_2011. This folder contains directories for this

course and several others.

Course material for the students can also be downloaded from within SolidWorks. Click the SolidWorks Resources tab in the Task Pane and then select Student Curriculum.

Double-click the course you would like to download. Control-select the course to download a ZIP file. The Lessons file contains the parts needed to complete the lessons. The Student Guide contains the PDF file of the course.

Course material for teachers can also be downloaded from the SolidWorks web site. Click the SolidWorks Resources tab in the Task Pane and then select Instructors Curriculum. This will take you to the Educator Resources page shown below.

SolidWorks Simulation Product Line

While this course focuses on the introduction to flow analysis using SolidWorks Flow Simulation, the full product line covers a wide range of analysis areas to consider. The paragraphs below lists the full offering of the SolidWorks Simulation packages and modules.

Static studies provide tools for the linear stress analysis of parts and assemblies loaded by static loads. Typical questions that will be answered using this study type are: Will my part break under normal operating loads? Is the model over-designed?

Can my design be modified to increase the safety factor?

Buckling studies analyze performance of the thin parts loaded in compression. Typical questions that will be answered using this study type are:

Legs of my vessel are strong enough not to fail in yielding; but are they strong enough not to collapse due to loss of stability?

Can my design be modified to ensure stability of the thin components in my assembly?

Frequency studies offer tools for the analysis of the natural modes and frequencies. This is essential in the design or many components loaded in both static and dynamic ways. Typical questions that will be answered using this study type are: Will my part resonate under normal operating loads? Are the frequency characteristics of my components suitable for the given application?

Can my design be modified to improve the frequency characteristics?

Thermal studies offer tools for the analysis of the heat transfer by means of conduction, convection, and radiation. Typical questions that will be answered using this study type are:

Will the temperatures changes effect my model? How does my model operate in an environment with temperature fluctuation?

How long does it take for my model to cool down or overheat? Does temperature change cause my model to expand?

Will the stresses caused by the temperature change cause my product failure (static studies, coupled with thermal studies would be used to answer this question)?

Drop test studies are used to analyze the stress of moving parts or assemblies impacting an obstacle. Typical questions that will be answered using this study type are: What will happen if my product is mishandled during transportation or dropped?

How does my product behave when dropped on hard wood floor, carpet or concrete?

Optimization studies are applied to improve (optimize) your initial design based on a set of selected criteria such as maximum stress, weight, optimum frequency, etc. Typical questions that will be answered using this study type are:

Can the shape of my model be changed while maintaining the design intent?

Can my design be made lighter, smaller, cheaper without compromising strength of performance?

Fatigue studies analyze the resistance of parts and assemblies loaded repetitively over long periods of time. Typical questions that will be answered using this study type are: Can the life span of my product be estimated accurately? Will modifying my current design help extend the product life?

Is my model safe when exposed to fluctuating force or temperature loads over long periods of time?

Will redesigning my model help minimize damage caused by fluctuating forces or temperature?

Nonlinear studies provide tools for analyzing stress in parts and assemblies that experience severe loadings and/or large deformations. Typical questions that will be answered using this study type are: Will parts made of rubber (o-rings for example) or foam perform well under given load?

Does my model experience excessive bending during normal operating conditions?

Dynamics studies analyze objects forced by loads that vary in time. Typical examples could be shock loads of components mounted in vehicles, turbines loaded by oscillatory forces, aircraft components loaded in random fashion, etc. Both linear (small structural deformations, basic material models) and nonlinear (large structural deformations, severe loadings and advanced materials) are available. Typical questions that will be answered using this study type are:

Are my mounts loaded by shock loading when vehicle hits a large pothole on the road designed safely? How much does it deform under such circumstances?

Introduction

Introduction

Motion Simulation enables user to analyze the kinematic and dynamic behavior of the mechanisns. Joint and inertial forces can subsequently be transferred into SolidWorks Simulation studies to continue with the stress analysis. Typical questions that will be answered using this modulus are:

What is the correct size of motor or actuator for my design? Is the design of the linkages, gears or latch mechanisms optimal? What are the displacemements, velocities and accelerations of the mechanism components?

Is the mechanism efficient? Can it be improved?

Composites modulus allows users to simulate structures manufactured from laminated composite materials. Typical questions that will be answered using this modulus are: Is the composite model failing under the given loading? Can the structure be made lighter using composite materials while not compromising with the strength and safety? Will my layered composite delaminate?

Basic Functionality of SolidWorks Flow Simulation

Goals of This Lesson

- Introduce flow analysis as a tool predicting characteristics of various flows over and inside 3D objects modeled by SolidWorks and thereby solving various hydraulic and gas dynamic engineering problems. Upon successful completion of this lesson, the students should understand basic approaches to solving hydraulic and gas dynamic engineering problems. The students should see that the analysis of the flow over complex objects can influence the objects' design and performance, significantly save time and money by performing a properly stated comprehensive CFD analysis with SolidWorks Flow Simulation instead of conducting extremely time-consuming and expensive experimental works.
- Associate SolidWorks Flow Simulation flow analysis as "a chess game", in which it is very easy "to arrange the figures over the board before the game", some effort is required "to obey the game rules", and it will be necessary to apply some strategy "to win the game", i.e. to obtain correct and accurate results. The students should see that, due to SolidWorks Flow Simulation's clear and well-structured interface, it is relatively easy "to arrange the figures over the board before the game", therefore the user will have more time to develop a strategy of solving the engineering problem, specify the boundary conditions properly, and study the obtained results for a possible change in strategy. So, this step shows how "to arrange the figures over the board before the game" in SolidWorks Flow Simulation.
- □ Show the students the proper ways of correctly simulating real objects and flow phenomena with SolidWorks Flow Simulation.

The results of analysis may vary slightly depending on versions/builds of SolidWorks and SolidWorks Flow Simulation.

Outline

- □ In Class Discussion Changing the Inlet Boundary Condition
- □ More to Explore Modifying the Geometry
- □ Exercises and Projects Hydraulic Loss Due to Sudden Expansion
- □ Lesson Summary

In Class Discussion

Ask students where a fluid flow and heat transfer analysis software can be beneficial for a design engineer?

Answer

- □ Machinery: Hydraulic/pneumatic systems manufacturers can improve their designs regarding flow distribution and pressure drop. Oil industry can better understand flow through valves or mixing vessels, etc. Particle tracking can be used to understand how safe equipment is against erosion.
- □ Electrical and Electronics: Designers of electronic devices (computers, audio/video, etc.) can check for efficient cooling by simulating convection and conduction within their designs.
- □ Aerospace and Automotive: Land-, air- and marine-vehicle designers can achieve maximum performance, at least cost: Manifolds, brake systems, engine cooling jacket, flow around a wing or through a rocket nozzle, flow around an immersed body etc.
- □ HVAC & Building: HVAC equipment manufactures can optimize product performance: flow through ducts, heat exchangers, flow and temperature distributors in rooms to determine duct locations, etc.
- □Consumer Products: Consumer products designers can improve the uniform distribution in an oven or correct the flow distribution in a dishwasher etc.
- Design engineers, analysts, and other professionals can recognize forces and torques and other loads acting on objects due to the fluid flow and use this knowledge in further structural analysis for achieving the better designs.

More to explore

Regarding structural analysis, ask the students how the forces acting on a particular object (whose stress is analyzed within SolidWorks Simulation) was determined. Are these forces always known or estimated from known formulas?

Answer

□ In some problems, even involving fluids, these forces are either well known or can be neglected. For example, a force acting on the chair's legs is determined as the weight of the student sitting on it in a room plus the chair's weight, or a force and moment acting on a manually operated small valve can be neglected. But determining the forces on many problems in industry are just too complicated and computer computations will be required to determine the needed forces. For example, if the valve is large, e.g. as used for hydroelectric power stations, both the force and the moment acting on the valve from the fluid must be certainly taken into account, otherwise the valve's parts (e.g. bearings) and devices (e.g. actuators turning the valve) can fail, so the valve becomes inoperative.

Active Learning Exercise — Determination of Hydraulic Loss

Use SolidWorks Flow Simulation to perform fluid internal analysis on the Valve.SLDPRT part shown to the right.

The step-by-step instructions are given below.

Opening the Valve.SLDPRT Document

1 Click File, Open. In the Open dialog box, browse to the Valve.SLDPRT part located in the corresponding subfolder of the SolidWorks Curriculum_and_Courseware_2011 folder and click Open (or double-click the part).

Checking the SolidWorks Flow Simulation Menu

If SolidWorks Flow Simulation is properly installed, the Flow Simulation menu appears on the SolidWorks menu bar. If not:

1 Click Tools, Add-Ins.

The Add-Ins dialog box appears.

2 Check the checkboxes next to SolidWorks Flow Simulation.

If SolidWorks Flow Simulation is not in the list, you need to install SolidWorks Flow Simulation first.

3 Click OK. The Flow Simulation menu appears on the SolidWorks menu bar.

Model Description

This is a ball valve. Turning the handle closes or opens the valve.

The local hydraulic loss (or resistance) produced by a ball valve installed in a piping system depends on the valve design dimensions and on the handle turning angle. The ball-to-pipe diameter ratio governs the handle turning angle at which the valve becomes closed.

The standard engineering definition of a hydraulic resistance of an obstacle in a pipe is the difference between the total pressures (i.e. where a stream is not disturbed by the obstacle) upstream and downstream of the obstacle (the valve in our case) divided by the incoming dynamic head, from which the hydraulic resistance due to the friction over the pipe section is subtracted.

In this example we will obtain the local hydraulic resistance of the ball valve whose handle is turned by an angle of 40° . The Valve analysis represents a typical SolidWorks Flow Simulation internal analysis.

Note: Internal flow analyses are analyses where fluid enters a model at the inlets and exits the model through the outlets. The exception are some natural convection problems that may not have openings.

To perform an internal analysis all the model openings must be closed with lids, which are needed to specify inlet and outlet flow boundary conditions on them. In any case, the internal model space filled with a fluid must be fully closed. The lids are simply additional extrusions covering the openings. They can be created both manually and automacially; both of the procedures are shown below.

Creating Lids Manually

Creating Inlet Lid

- 1 Select the face shown in the picture.
- 2 Click Sketch 🛃 on the Sketch toolbar.

- **3** Select the tube's inner edge.
- 4 Click **Convert Entities ()** on the Sketch toolbar. Click **√** in the **Convert Entities** PropertyManager once the entity is converted.
- 5 Complete the sketch by clicking **OK** button ^S in the confirmation corner of the graphics area.

🕞 Boss-Extrude 🖌 💥 ගි

Sketch Plane

Mid Plane

0.00500000m

Merge result

Draft outward

•

1

From

C_{D1}

Direction 1

- 6 Click **Extruded Boss/Base** 🙀 on the Features toolbar.
- **7** In the **Extrude** Feature PropertyManager change the settings as shown.
 - End Condition = Mid Plane
 - Depth = 0.005m
- 8 Click 🖌 to create the inlet lid.

Next, in the same manner we will create the outlet lid.

Creating Outlet Lid

- 1 Select the face shown in the picture.
- 2 Click Sketch 🛃 on the Sketch toolbar.

- **3** Select the tube's inner edge.
- 4 Repeat the steps 3 to 8 to create the lid at outlet.
- 5 Rename the new extrusions Extrude1 and Extrude2 to Inlet Lid and Outlet Lid, correspondingly.

Not sure you have created the lids properly? SolidWorks Flow Simulation can easily check your model for possible geometry problems.

Checking the Geometry

- 1 To ensure the model is fully closed, click **Flow Simulation, Tools, Check Geometry**.
- 2 Click **Check** to calculate the fluid volume of the model. If the fluid volume is equal to zero, the model is not closed properly.
 - **Note:** This **Check Geometry** tool allows you to calculate the total fluid and solid volumes, check bodies for possible geometry problems (i.e. tangent contact) and visualize the fluid area and solid body as separate models.

Creating Lids Automatically

The previous step showed the manual lid creation. In the next step you will practice the SolidWorks Flow Simulation automatic lid creation tool. This tool can save considerable amount of time if multiple lids are needed to close the internal volume.

Deleting manually created lids

Delete Inlet Lid and Outlet Lid features.

Creating Inlet and Outlet Lids

- 1 Click Flow Simulation, Tools, Create Lids. The Create Lids dialog box appears.
- 2 Select the two inlet and outlet faces shown in the figure.
- 3 Click ✓ to complete the lid definitions.
- 4 Rename the newly created features LID1 and LID2 to Inlet Lid and Outlet Lid, respectively.

Note: In the assembly mode, each newly created lid forms a new part saved in the assembly folder.

The first step in performing flow analysis is to create a SolidWorks Flow Simulation project.

Creating a Project

- 1 Click **Flow Simulation**, **Project**, **Wizard**. The project wizard guides you through the definition of a new SolidWorks Flow Simulation project.
- 2 In the **Project Configuration** dialog box, click **Use current** (40 degrees).

Each SolidWorks Flow Simulation project is associated with a SolidWorks configuration. You can attach the project either to the current SolidWorks configuration or create a new SolidWorks configuration based on the current one.

Click Next.

3 In the **Unit System** dialog box you can select the desired system of units for both input and output (results).

For this project we accept the default selection of **SI** (International System). Click **Next**.

4 In the **Analysis Type** dialog box you can select either **Internal** or **External** type of the flow analysis. This dialog also allows you to specify advanced physical features you want to take into account: heat transfer in solids, surface-to-surface radiation, time-dependent effects, gravity and rotation.

Specify **Internal** type and accept the default values for the other settings. Click **Next**.

5 In the Default Fluid dialog box you can select the fluid type. The selected fluid type is assigned by default for all fluids in the analysis.

Click **Liquids** and then double-click the **Water** item in the **Liquids** list. Leave defaults under **Flow Characteristics** and click **Next**.

	Fluids	Path		New
	- Methane	Pre-Defined	-	
	Methanol	Pre-Defined		
	- Ntrogen	Pre-Defined		
	- Oxygen	Pre-Defined	_	
	- Propane	Pre-Defined		
	- R123	Pre-Defined		
	R134a	Pre-Defined	1	
	- R22	Pre-Defined		
	RC318	Pre-Defined		
	Non-Newtonian Liquids			
	Compressible Liquids		+	Add
	Project Fluids	Default Fluid		Remove
	Water (Liquids)	V		
	Flow Characteristic Flow type	Value Laminar and Turbulent		
C	Cavitation		_	

Note: The SolidWorks Flow Simulation **Engineering Database** contains physical properties of predefined and user-defined gases, real gases, incompressible liquids, non-Newtonian liquids, compressible liquids, solid substances and porous materials. It includes both constant values and tabular dependencies of various physical parameters on temperature and pressure.

The Engineering Database also contains unit systems, values of thermal contact resistance for various solid materials, properties of radiative surfaces and integral physical characteristics of some technical devices, namely, fans, heat sinks, and thermoelectric coolers. You can easily create your own substances, units, fan curves or specify a custom parameter you want to visualize.

6 In the **Wall Conditions** dialog box you can specify the wall roughness value and the wall thermal condition.

In this project we will not deal with the rough walls and heat conduction through the walls, so leave the default settings and click **Next**.

7 In the **Initial Conditions** dialog box specify initial values of the flow parameters. For steady internal problems, the values specified closer to the expected flow field will reduce the analysis time.

For this project use the default values.

Note: For steady flow problems SolidWorks Flow Simulation iterates until the solution converges. For unsteady (transient, or time-dependent) problems SolidWorks Flow Simulation marches in time for a period you specify.

8 In the Results and Geometry

Resolution dialog box you can control the analysis accuracy as well as the mesh settings and, by this, the required computer resources (CPU time and memory).

For this project accept the default **Result** resolution level **3**.

Result resolution governs the solution accuracy that can be interpreted as resolution of calculation results. You

specify result resolution in accordance with the desired solution accuracy, available CPU time and computer memory. Because this setting has an influence on the number of generated mesh cells, a more accurate solution requires longer CPU time and more computer memory.

Geometry Resolution (specified through the **Minimum gap size** and the **Minimum wall thickness**) governs proper resolution of geometrical model features by the computational mesh. Naturally, finer geometry resolution requires more computer resources.

Select the **Manual specification of the minimum gap size** check box and enter **0.04 m** for the minimum flow passage.

Note: SolidWorks Flow Simulation calculates the default minimum gap size and minimum wall thickness using information about the overall model dimensions, the computational domain, and faces on which you specify conditions and goals. However, this information may be insufficient to recognize relatively small gaps and thin model walls. This may cause inaccurate results. In these cases, the Minimum gap size and Minimum wall thickness must be specified manually.

Click Finish.

SolidWorks Flow Simulation Design Tree

After the basic part of the project has been created, a new SolidWorks Flow Simulation design tree tab 💿 appears on the right side of the Configuration Manager tab.

Note: The SolidWorks Flow Simulation Design Tree provides a convenient specification of project data and view of results. You also can use the SolidWorks Flow Simulation design tree to modify or delete the various SolidWorks Flow Simulation features.

At the same time, in the SolidWorks graphics area a computational domain wireframe box appears. The flow and heat transfer calculations are performed inside the computational domain. The computational domain is a rectangular prism for both the 3D and 2D analyses. The computational domain boundaries are parallel to the global coordinate system planes.

Now let us specify the other parts of the project.

The next step is the specifycation of the boundary conditions. Boundary conditions are used to specify the fluid characteristics at the model inlets and outlets in an internal flow analysis or on model surfaces in an external flow analysis.

Specifying Boundary Conditions

1 Click Flow Simulation, Insert, Boundary Condition.

2 Select the Inlet Lid inner face (in contact with the fluid). To access the inner face, right-click the lid's outer face and choose **Select Other**. Right-click the mouse to cycle through the faces under the cursor until the inner face is highlighted, then click the left mouse button.

The selected face appears in the **Faces to Apply the Boundary Condition** ist.

- 3 In the **Type** group box, click **Flow Openings ⊨** and select the **Inlet Velocity** item.
- 4 In the Flow Parameters group box, click Normal to Face item and set the Velocity Normal to Face ✓ to 1 m/s (just type the value, the units will appear automatically).

Accept all other parameters and click \checkmark .

By specifying this condition we define that the water enters the valve at the ball valve pipe inlet with the velocity of 1.0 m/s.

5 Select the Outlet Lid inner face.

In the graphics area, right-click outside the model and select **Insert Boundary Condition**. The **Boundary Condition** PropertyManager appears with the selected face in the **Faces to Apply the Boundary Condition ()** list.

 Type
 Image: Constraint of the second sec

Let us specify pressure on this boundary, otherwise the problem specification is deficient. Before the calculation starts, SolidWorks Flow Simulation checks the specified boundary conditions for mass flow rate balance. The specification of boundary conditions is incorrect if the total mass flow rate on the inlets is not equal to the total mass flow rate on the outlets. In such case the calculation will not start. Also, note that the mass flow rate value is recalculated from the velocity or volume flow rate value specified on an opening. Specifying at least one Pressure opening condition allow us to avoid problems with mass flow rate balance, since the mass flow rate on a Pressure opening is not specified but calculated during the problem solution.

- 6 Click Pressure Openings 🔯 and in the Type of Boundary Condition list select the Static Pressure item.
- 7 Accept the default values for all of the other parameters (101325 Pa for Static Pressure, 293.2 K for the Temperature, for example).
- 8 Click 🖌.

Engineering Goals

By specifying this condition we define that the water has a static pressure of **1 atm** at the ball valve pipe exit.

The model's hydraulic loss ξ is calculated as the difference between the model's inlet total pressure and the outlet total pressure, ΔP , divided by the dynamic pressure (dynamic head) determined at the model inlet:

$$\xi = (dP) / \frac{\rho V^2}{2} = (dP) / P_{dyn}$$

where ρ is water density, V is water inlet velocity, P_{dyn} is the dynamic pressure at inlet. Since we already know the specified water velocity $(1 \frac{m}{s})$ and the water density (998.1934 $\frac{kg}{3}$ for the specified temperature of 293.2 K), our goal is to determine the total pressure

 $\frac{kg}{3}$ for the specified temperature of 293.2 K), our goal is to determine the total pressure value at the value's inlet and outlet.

The easiest and fastest way to find the parameter of interest is to specify the corresponding engineering goal.

Engineering goals are the parameters which the user is interested in. Setting goals is essentially a way of conveying to SolidWorks Flow Simulation what you are trying to get out of the analysis, as well as means of reducing the time SolidWorks Flow Simulation takes to reach a solution. By only selecting the variable which the user desires accurate values for, SolidWorks Flow Simulation knows which variables are important to converge upon (the variables selected as goals) and which can be less accurate (the variables not selected as goals) in the interest of time. Goals can be defined over the entire domain (**Global Goals**), within a selected volume (**Volume Goal**), on a selected area (**Surface Goal**) or at a specific point of the model (**Point Goal**). Furthermore, SolidWorks Flow Simulation can consider either average, minimum or maximum parameter value to define the goal. You can also define an **Equation Goal** that is a goal defined by an equation (involving basic mathematical functions) with the existing goals as variables. The equation goal allows you to calculate the parameter of interest (i.e., pressure drop) and keeps this information in the project for later reference.

Specifying Surface Goals

- 1 In the SolidWorks Flow Simulation design tree, rightclick the Goals icon and select Insert Surface Goal.
- 2 Select the inner face of the Inlet Lid.

To easily select a face, simply click the Inlet Velocity 1 item in the SolidWorks Flow Simulation design tree. The face related to the specified boundary condition is automatically selected and appears in the **Faces to Apply the Surface Goal** list.

3 In the **Parameter** list, find **Total Pressure**. Click in the **Av** column to use the average value and keep selected **Use for conv.** to use this goal for the convergence control.

Note: To see the parameter names more clearly, you will probably find useful to enlarge the PropertyManager area by dragging the vertical bar to the right.

- 4 Click 🖌.
- 5 In the SolidWorks Flow Simulation design tree click-pause-click the new SG Av Total Pressure 1 item and rename it to SG Average Total Pressure Inlet.

🖨 🏁 Goa	s
- i	SG Average Total Pressure Inlet

Note: Another way to rename an item is to right-click the item and select **Properties**.

- 6 Right-click the Goals icon again and select Insert Surface Goal.
- 7 Click the Static Pressure 1 item in the SolidWorks Flow Simulation design tree to select the inner face of the Outlet Lid.
- 8 In the Parameter list, find Total Pressure.
- 9 Click in the Av column and then click \checkmark .
- **10** Click-pause-click the new SG Av Total Pressure 1 item and rename it to SG Average Total Pressure Outlet.
- 11 Right-click the Goals icon again and select Insert Surface Goal.
- 12 Click the Inlet Velocity 1 item to select the inner face of the Inlet Lid.
- 13 In the Parameter list, find Dynamic Pressure.
- 14 Click in the Av column and then click \checkmark .
- 15 Click-pause-click the new SG Average Dynamic Pressurel item and rename it to SG Average Dynamic Pressure Inlet.

The value of the dynamic pressure at the inlet can be

calculated manually. We have specified the dynamic pressure goal just for the convenience of the further calculation of hydraulic losses.

After finishing the calculation you will need to manually calculate the hydraulic loss ξ from the obtained total pressures values. Instead, let SolidWorks Flow Simulation make all the necessary calculations for you by specifying an Equation Goal.

Specifying the Equation Goal

Equation Goal is a goal defined by an analytical function of the existing goals. This goal can be monitored during the calculation and while displaying results in the same way as the other goals. Any of the existing goals can be used as variables, including other equation goals, except those that are dependent on other equation goals. You can also use constants in the definition of the equation goal.

 Ital base
 Dimensionally:

 Ital base
 Dimensionally:
- 7 In the Goals list select the SG Average Dynamic Pressure Inlet goal name.
- 8 In the **Dimensionality** list select **No units**.
 - **Note:** To set an Equation Goal you can use only existing goals (including previously specified Equation Goals) and constants. If constants signify some physical parameters (i.e. length, area etc.) make sure of using the project's system of units. SolidWorks Flow Simulation has no information about the physical meaning of the specified constants so you need to specify the displayed dimensionality manually.
- 9 Click OK. The Equation Goal 1 item appears in the tree.

10 Rename it to Hydraulic Loss.

Now the SolidWorks Flow Simulation project is ready for the calculation. SolidWorks Flow Simulation will finish the calculation when the steady-state average value of total pressure calculated at the valve inlet and outlet are reached.

Running the Calculation

- 1 Click Flow Simulation, Solve, Run. The Run dialog box appears.
- 2 Click **Run** to start the calculation.

The calculation should take about 2 minutes to run on a 2.26 GHz Pentium M computer.

SolidWorks Flow Simulation automatically generates a computational mesh in accordance with your settings of Result resolution and Geometry resolution. The mesh is created by dividing the computational domain into cells, i.e. elementary rectangular volumes. The cells are further subdivided as necessary to resolve properly the model geometry and flow features. This process is called mesh refinement. During the

Hydraulic Loss	
Add All Remove All	
Plot appliant Goal plot 1	-
riot caption. [croat plot 1	

This is the Goal Plot dialog box. All added goals together with their current values are listed at the top part of the window, as well as the current progress towards completion given as a percentage. The progress value is only an estimate and generally (but not necessarily) increases with time. Below you can see the graph of all goals.

Convergence is an iterative process. The discretization of the flow field imposes conditions on each parameter and each parameter cannot reach an absolutely stable value but will oscillate near this value from iteration to iteration. When

SolidWorks Flow Simulation analyzes the goal's convergence, it calculates the goal's dispersion defined as the difference between the goal's maximum and minimum values over the analysis interval reckoned from the last iteration and compares this dispersion with the goal's convergence criterion dispersion, either specified by you or automatically determined by SolidWorks Flow Simulation. Once the oscillations are less than the convergence criterion the goal becomes converged.

Preview Results

- While the calculation is still running, click Insert Preview in on the Solver toolbar. The Preview Settings dialog box appears.
- 2 Click the FeatureManager tab 🕵.

Preview Settings		X
Definition Settings Imag Plane definition Plane name: Plane offset:	e Attributes Options Region Plane2 0 m	OK Cancel Help
Min/Max mode C Manual min/max Auto min/max	Mode C Contours C Isolines C Velocity vectors	

3 Select Plane 2.

For this model Plane 2 is a good choice to use as the preview plane. The preview plane can be chosen anytime from the Feature Manager.

- 4 Click **OK** to display the preview plot of the static pressure distribution.

Note: You can specify a parameter you want to display in the preview plane, the parameter range and display options for velocity vectors at the **Setting** tab of the **Preview Settings** dialog box.

The preview allows one to look at the results while the calculation is still running. This helps to determine if all the boundary conditions are correctly defined and gives the user idea of how the solution will look even at this early stage.

At the start of the run the results might look odd or change abruptly. However, as the run progresses these changes will lessen and the results will settle in on a converged solution. The result can be displayed either in contours, isolines or vector representation.

- **Note:** Why does the static pressure increase at the local region inside the valve? This is due to a deceleration (up to stagnation within a small region) of the stream impacting the valve's wall in this region, so the stream's dynamic pressure is partly transformed into the static pressure while the stream's total pressure is nearly constant in this region, so the static pressure rises.
- 5 When the solver is finished, close the monitor by clicking **File**, **Close**.

Accessing the Results

Expand the Results folder in the project tree by clicking the corresponding (+) sign.

Note: When the solver is finished, the results are loaded automatically (unless the **Load results** check box in the **Run** window has been unchecked). However, when working with a previously calculated project, you need to load the results manually by clicking **Flow Simulation**, **Results**, **Load/Unload Results**.

Once the calculation finishes, you can view the saved calculation results in numerous ways and in a customized manner directly within the graphics area. The Result folder features functions that may be used to view your results: Cut Plots (section views of parameter distribution), 3D-Profile Plots (section views in relief representation), Surface Plots (distribution of a parameter on a selected surface), Isosurfaces, Flow Trajectories, Particle Studies (particle trajectories), XY Plots (diagrams of parameters behavior along a curve or sketch), Point Parameters (getting parameters at specified points), Surface Parameters (getting parameters at specified surfaces), Volume Parameters (getting parameters within specified volumes), Goals (behavior of the specified goals during the calculation), Reports (export of project report output into MS Word) and Animation of results.

Creating a Cut Plot

1 Right-click the Cut Plots icon and select Insert. The Cut Plot dialog box appears.

The Cut Plot displays results of a selected parameter in a selected view section. To define the view section, you can use SolidWorks planes or model planar faces (with the additional shift if necessary). The parameter values can be represented as a contour plot, isolines, vectors, or in a combination (e.g. contours with overlaid vectors).

- 2 Click the SolidWorks FeatureManager and select Plane2. Its name appears in the Section Plane or Planar Face list on the Selection tab.
- 3 In the Cut Plot PropertyManager window, in addition to displaying Contours ≝, click Vectors ⅔.
- 4 In the **Contours** group box, in the **Parameter** box select **X**-**Component of Velocity**.
- 5 In the Vectors group box, using the slider set the Vector Spacing to approximately 0.012 m.
- 6 Click v to create the cut plot. The new Cut Plot 1 item appears in the SolidWorks Flow Simulation design tree.

However, the cut plot is not seen through the model. In order to see the plot, you can hide the model by clicking **Flow Simulation**, **Results**, **Display**, **Geometry** (alternatively, you can use the standard SolidWorks **Section View** option) or change the model transparency (as is done in the next step below).

1 Click the Flow Simulation, Results, Display, Geometry to show the model. Click Flow Simulation, Results, Display, Transparency and drag the slider to set the value of approximately 0.85.

Click 🖌.

o see the plot, you can hide ometry (alternatively, you ge the model transparency

Gradient plot

2 In the SolidWorks Flow Simulation design tree, right-click the Computational Domain icon and select **Hide**.

Now you can see a contour plot of the velocity and the velocity vectors projected on the plot.

For better visualization of the vortex you can scale small vectors:

- 1 In the SolidWorks Flow Simulation design tree, under Cut Plots, right-click the Cut Plot 1 icon and select **Edit Definition**.
- 2 In the Vectors group box,select Adjust Minimum and Maximum. Change the Min value to 2 m/s.

Type **0.02 m** in the **Arrow size** box.

By specifying the custom **Min** we change the vector length so the vectors whose velocity is less than the specified Min value will have the same length as the vectors whose velocity is equal to the Min. This allows us to visualize the low velocity area in more details.

Click **OK** to save the changes and exit the dialog box. Immediately the cut plot is updated.

Displaying Flow Trajectories

With the use of **Flow trajectories** you can show the flow streamlines. Flow streamlines provide a very clear and comprehensible representation of the flow peculiarities. You can also see how parameters change along each trajectory by exporting data into Excel. Additionally, you can save trajectories as SolidWorks reference curves.

- 1 Right-click the Cut Plot 1 icon and select Hide.
- 2 Right-click the Flow Trajectories icon and select **Insert**. The **Flow Trajectories** dialog box appears.
- 3 In the SolidWorks Flow Simulation Design Tree, click the Static Pressure 1 item to select the inner face of the Outlet Lid. Trajectories launched from the outlet opening will better visualize the vortex occurring downstream the valve's obstacle.
- 4 Set the Number of points to 50.
- 5 Click the **Constraints** tab and decrease the **Maximum length** of trajectories to **2 m**.
- 6 Click **OK** to display trajectories.

Rotate the model to examine the 3D structure of the vortices in more detail.

Creating a Goal Plot

The Goal Plot allows you to study the goal changes in the course of the calculation. SolidWorks Flow Simulation uses Microsoft Excel to display the goal plot data. Each goal plot is displayed in a separate sheet. The converged values of all project goals are displayed in the Summary sheet of an automatically created Excel workbook.

- 1 In the SolidWorks Flow Simulation design tree, under Results, right-click the Goals icon and select **Insert**. The **Goal Plots** dialog box appears.
- 2 Click Add All.
- 3 Click **OK**. The goals1 Excel workbook is created.

This workbook displays how the goal values had changed during the calculation. You can take the total pressure value presented in the Summary sheet.

Iterations: 87 Analysis interval: 21

Cloning Project

The current calculation yields the total hydraulic resistance ξ including both valve's hydraulic resistance ξv (due to the obstacle) and the tubes' hydraulic resistance due to friction $\xi_f: \xi = \xi v + \xi_f$. To obtain the valve's resistance, it is necessary to subtract from the obtained data the total pressure loss due to friction in a straight pipe of the same length and diameter. To do that, we will perform the same calculations in the ball valve model whose handle is turned by an angle of 0° .

You can create a new SolidWorks Flow Simulation project in three ways:

- The Project Wizard is the most straightforward way of creating a SolidWorks Flow Simulation project. It guides you step-by-step through the analysis set-up process.
- To analyze different flow or model variations, the most efficient method is to clone (copy) your current project. The new project will have all the settings of the cloned project, optionally including the results settings.
- You can create a SolidWorks Flow Simulation project by using a Template, either a default template or custom template created from a previous SolidWorks Flow Simulation project. Template contains only general project settings (the settings you specify in the Wizard and General Settings only) and does not contain the other project features like boundary conditions, goals, etc.

The easiest way to create a new SolidWorks configuration for 0° angle and specify the same condition as the 40° angle project is to clone the existing **40 project**.

- 1 Click Flow Simulation, Project, Clone Project.
- 2 Click Create New.
- 3 In the **Configuration name** box, type 00 degrees.
- 4 Click OK.

Now the new SolidWorks Flow SimulationSolidWorks Flow Simulation project is attached to the new 00 degrees configuration and has inherited all the settings

Clone Project
Create new
 Add to existing
Configuration name:
00 degrees
Existing configuration:
· · · · · · · · · · · · · · · · · · ·
Copy results
OK Cancel Help

from the 40 degrees project. All our input data is copied, so we do not need to redefine anything. All changes will only be applied to this new configuration, not affecting the old project and its results.

Changing the Valve Angle

Feature.

1 In the SolidWorks FeatureManager, right-click the Angle Definition feature and select **Edit**

→ Plane2 → Plane3	↔ Angle Definition	?
Axis1	Selections	~
Image: Contract of the second seco	Axis1 Plane1	
	Through Lines/Points	

2 A Flow Simulation warning appears:

Flow Simulation has detected that the model was modified. Do you want to reset mesh settings?

Click Yes.

Click **OK** if a rebuild error appears.

3 In the At angle box, type 90.

Click OK 🖌

4 After clicking **OK**, two warning messages appear asking you to rebuild the computational mesh and to reset the computational domain.

Answer **Yes** to the both messages.

Changing the Geometry Resolution

Since at the zero angle the ball valve becomes a simple straight pipe, there is no need to set the **Minimum gap size** value smaller than the default gap size which, in our case, is automatically set equal to the pipe's diameter (the automatic minimum gap size depends on the characteristic size of the faces on which the boundary conditions are set). Note that using a smaller gap size will result in a finer mesh which, in turn, will require more CPU time and memory. To solve your task in the most effective way you should choose the optimal settings for the task.

- 1 Click Flow Simulation, Initial Mesh.
- 2 Clear the Manual specification of the minimum gap size check box.
- 3 Click OK.

Changing the Computational Domain

You can take advantage of the symmetry of the straight pipe to reduce the CPU time and memory requirements for the computation. Since the flow is symmetric at two directions (Y and Z), it is possible to "cut" the model in one fourth and use a symmetry boundary condition on the planes of symmetry. This procedure is not required but is recommended for efficient analyses.

Note: The symmetric conditions can be applied only if you are sure that the flow is symmetric. Note that sometimes symmetry of both the model and the incoming flow does not guarantee symmetry in other flow regions, e.g. a von Karman vortex street behind a cylinder. In our case, the flow in the straight pipe is symmetric so we can reduce the computational domain.

1 In the SolidWorks Flow Simulation design tree right-click the Computational Domain icon and select Edit Definition. The Computational Domain dialog box appears.

In the **Computational Domain** dialog box you can perform the following:

- Resize the Computational Domain.
- Apply the **Symmetry** boundary condition. The flow symmetry planes can be utilized as computational domain boundaries with specified **Symmetry** conditions on them. In this case, the computational domain boundaries must coincide with the flow symmetry planes.

- Specify a **2D plane flow**. If you are fully confident that the flow is a 2D plane flow, you can redefine the computational domain from the default 3D analysis to a 2D plane flow analysis that results in decreases in memory and CPU time requirements. To activate a 2D planar analysis, select **2D plane flow** on the **Boundary Condition** tab.
- 2 In the Y min box type **0**.
- 3 In the **Z** min box type **0**.
- 4 In the At Y min and At Z min lists select Symmetry.
- 5 Click OK.

Click Flow Simulation, Solve, Run. Then click Run to start the calculation.

Getting the Valve's Hydraulic Loss

After the calculation is finished, close the monitor dialog box and create the goal plot with the newly obtained results.

Valve.SLDPRT [00 degrees]

SG Av Dynamic Pressure I	[Pa]	498.7808697	498.7808697	498.7808697	498.7808697	100	Yes	0	4.98781E-06
Hydraulic Loss	[]	0.187406851	0.198339191	0.186275659	0.252924696	100	Yes	0.066649038	0.299646221

Now you can calculate the valve's hydraulic loss in the ball valve whose handle is turned by 40° . To determine the parameter's steady-state value more accurately, it would be more accurate to use the values averaged over the analysis interval, which are shown in the Averaged Value column.

Total hydraulic losses (40 deg)	Friction losses (0 deg)	Valve's loss
20.98	0.19	20.79

Save Your Work and Exit SolidWorks

- 1 Click **[**] on the Standard toolbar or click **File**, **Save**.
- 2 Click File, Exit on the Main menu.

5 Minute Assessment – Answer Key

1 What is SolidWorks Flow Simulation?

<u>Answer:</u> SolidWorks Flow Simulation is a fluid flow and heat transfer analysis product fully integrated within SolidWorks.

- How do you start a SolidWorks Flow Simulation session?
 <u>Answer:</u> On the Windows task bar, click Start, Programs, SolidWorks, SolidWorks Application. The SolidWorks application starts.
- **3** What is a fluid flow analysis?

Answer: Fluid flow analysis is a process to simulate how the fluid influences the design and performance of your device or to simulate how a device affects the fluid flow parameters.

4 Why analysis is important?

<u>Answer:</u> Analyses enables you to understand and improve your design saving your time and money by reducing traditional design cycle.

5 What kind of analyses is typical for SolidWorks Flow Simulation internal flow analyses?

<u>Answer:</u> Typical internal analyses are those when the fluid enters a model at the model inlets and exits the model through outlets.

- 6 What is the specific requirement of SolidWorks Flow Simulation internal analyses? <u>Answer:</u> SolidWorks Flow Simulation internal analyses require that the models be fully closed.
- 7 How can you ensure the model is closed?
 <u>Answer:</u> You can calculate the model's internal volume by using the Check Geometry tool. If the volume is zero, your model is not closed.
- 8 Why is it necessary to add lids to the ball valve model openings?
 <u>Answer:</u> Lids make the model closed for an internal analysis. You will need to apply inlet and outlet boundary conditions on the lids.
- 9 What is the first step to start a SolidWorks Flow Simulation analysis? <u>Answer:</u> The first step to start a SolidWorks Flow Simulation analysis is to create a SolidWorks Flow Simulation project.
- **10** In what ways can a SolidWorks Flow Simulation project be created? SolidWorks Flow Simulation project can be created in one of the three ways:
 - use the Project Wizard.
 - use the template.
 - clone an existing project.
- 11 How do you specify a fluid for a project?

<u>Answer:</u> To specify a fluid for a project, select the fluid from a list of fluids in the SolidWorks Flow Simulation Engineering Database from the **Wizard** (or **General Settings**) dialog box.

12 How does a user define a fluid entering the model with a velocity of 1 m/s? **Answer:** Do the following:

- In the Flow Simulation design tree, right-click the Boundary Conditions item and select Insert Boundary Condition.
- Select the inlet opening's surface.
- Select the Inlet Velocity boundary condition type.
- Under Flow Parameters, set Velocity normal to face to 1 m/s.
- Click OK.
- **13** The model has a mirror symmetry. Is it OK then to use the Symmetry boundary condition at the model's symmetry plane?

<u>Answer:</u> No. The symmetry condition should be only applied if the flow is symmetric. The geometric symmetry of the model does not always mean that the flow is also symmetric.

14 How do you define a 2D XY plane flow analysis?

Answer: To define a 2D XY plane flow analysis:

- Right-click the Computational Domain icon in the SolidWorks Flow Simulation design tree and select **Edit Definition**.
- Click the Boundary Condition tab.
- Under 2D plane flow select XY plane flow.
- Click OK.
- 15 Is it necessary to specify project goals to start the calculation?

Answer: No.

16 How do you start a calculation?

Answer: Click Flow Simulation, Solve, Run, then click Run.

17 In the case when you are working with the previously calculated project, what needs to be done first before viewing the result information?

Answer: The first action is to load results.

18 What display features are available in SolidWorks Flow Simulation to view the calculation results?

Answer:

- Cut Plots and Surface Plots (with contours, isolines, vectors)
- 3D-Profile Plots
- XY Plots
- Isosurfaces
- · Flow and particles trajectories
- Point, surface and volume parameters
- Goal Plots
- MS Word Reports
- Animation of results
- 19 How can you calculate the total pressure value for a steady state incompressible fluid? <u>Answer:</u> For a steady state incompressible fluid the total pressure can be calculated as the sum of static pressure and dynamic head.

20 What is the definition of the total hydraulic resistance (loss) of an obstacle in a pipe? <u>Answer:</u> It is the difference between the total pressure taken upstream of the obstacle and total pressure taken downstream of the obstacle divided by the incoming dynamic head.

In Class Discussion — Changing the Inlet Boundary Condition

Open the Valve.SLDPRT part. Activate the 40 degrees configuration:

- 1 Click the ConfigurationManager 🖳 tab.
- In the SolidWorks ConfigurationManager, right-click the 40 degrees item and select Show Configuration.

Ask the students to specify the mass flow rate of 19 kg/s at the inlet opening and calculate the total (including the friction loss) hydraulic loss.

Answer

To specify the inlet mass flow rate of 19 kg/s do the following:

Specify inlet mass flow rate of 19 kg/s

1 In the Flow Simulation Design tree, right-click the Inlet Velocity 1 icon and select **Edit Definition**.

The Boundary Condition dialog box appears.

- 2 In the Type of Boundary Condition list, select Inlet Mass Flow.
- **3** Under Flow Parameters, set the Mass Flow Rate Normal to Face to 19 kg/s.
- 4 Click 🖌.

With the definition just made, we told SolidWorks Flow Simulation that at this opening 19 kilograms of water per second is flowing into the valve. The mass flow at the outlet does not need to be specified due to the conservation of mass; mass flow in equals mass flow out.

Run the analysis and obtain the total hydraulic loss

- 1 In the Flow Simulation Design tree, right-click the 40 degrees icon and click **Run**, or click **Flow Simulation**, **Solve**, **Run**.
- 2 Select New Calculation and click Run. The calculation starts. When calculation is finished, close the Solver Monitor dialog box.

Note: To get the new results, you do not need to remesh the model.

3 Right-click the Goals icon under the Results folder and select **Insert**. The **Goals** dialog box appears.

More to Explore — Modifying the Geometry

Ask the students to change the handle angle to 30 degrees and calculate the total hydraulic loss in this ball valve.

<u>Answer</u>

- □ Click the FeatureManager tab 🥵.
- □ Right-click the plane item named Angle Definition and select **Edit Definition**.
- □ Set the **At Angle** property to **60**.
- 🛛 Click 🖌.
- \Box Select Yes for each message that appears after you click \checkmark .
- Click the ConfigurationManager tab and rename the
 40 degrees configuration to 30 degrees.
- □ Click Flow Simulation, Solve, Run. The solver starts.
- □ After finishing the calculation, click **File**, **Close** to close the solver monitor dialog box.
- \Box Click the Flow Simulation design tree $\boxed{100}$ tab.
- □ In the SolidWorks Flow Simulation design tree, under Results, right-click the Goals icon and select Insert. The Goals dialog box appears.
- □ Click Add All.
- □ Click **OK**. The Excel workbook is created.

Valve.SLDPRT [30 degrees 19]

Goal Name	Unit	Value	Averaged Value	Minimum Value	Maximum Value	Progress [%]	Use In Convergence	Delta	Criteria
SG Av Total Pressure Inlet	[Pa]	116942.857	117017.8313	116939.2339	117159.0582	100	Yes	144.4448607	636.5041935
SG Av Total Pressure Outle	[Pa]	103514.143	103530.2663	103514.143	103556.851	100	Yes	24.6500292	31.25643541
SG Av Dynamic Pressure I	[Pa]	2009.762517	2009.762517	2009.762517	2009.762517	100	Yes	0	2.00976E-05
Hydraulic Loss	11	6.681741651	6.711024305	6.678638717	6.768066908	100	Yes	0.065138725	0.308973318

You can see that the hydraulic loss becomes much lower compared to the 40 degrees valve.

Exercises and Projects — Hydraulic Loss Due to Sudden Expansion

When the fluid passes through ball valve it undergoes two sudden contractions and two sudden expansions. Let us employ SolidWorks Flow Simulation to calculate the hydraulic loss in the simple 2D channel with the sudden expansion.

Tasks

1 Open the Bilateral expansion channel.sldprt file in the part located in the corresponding subfolder of the SolidWorks

Curriculum_and_Courseware_2011 folder.

The model is a shell so it is fully closed (the front face on the picture at the right is made transparent to view the results). Therefore, there is no need to create lids.

For easy selection, check that the **Enable** selection through transparency option is enabled under the **Display/Selection** page of the **System Options** dialog box, accessible by clicking **Tools**, **Options**.

- 2 Using the Wizard, create the SolidWorks Flow Simulation project for internal water analysis with the Result resolution level set to 5 (all other settings are default).
 Answer: Do the following:
 - Click Flow Simulation, Project, Wizard.
 - Enter a configuration name and click **Next**.
 - Click **Next** to accept the default **SI** unit system.
 - Click Next to accept Internal analysis type.
 - Select Water for Liquid and click Next.
 - Click Next to accept the defaults of zero Roughness and Adiabatic wall.
 - Click **Next** to accept the default initial conditions.
 - Move the **Result resolution** slider to **5** and click **Finish** to complete the project definition.
- 3 Specify that water with the velocity of 1 m/s enters the model through the inlet opening. What is the mass flow rate of the incoming water in this case?

Answer: Do the following:

- Click Flow Simulation design tree tab 🔯 .
- In the Flow Simulation design tree, right-click the Boundary Conditions item and select Insert Boundary Condition.
- Select the inlet opening face (colored in green).
- Under Type, select Inlet Velocity.

Specify static atmosphere pressure

at this face

- Under Flow Parameters, enter 1 m/s for Velocity Normal to Face V. Notice that it is equivalent to specifying the mass flow rate of 9.98 kg/s: $m = \rho VA = 998.15*1*0.01$.
- Click 🖌.
- 4 Specify that water exits the model through the outlet opening to an area of static atmosphere pressure. What is the value of the ambient static atmosphere pressure in Pa?

Answer: Do the following:

- In the Flow Simulation design tree, right-click the Boundary Conditions item and select Insert Boundary Condition.
- Select the outlet opening face (colored in green).
- Under **Type**, click **Pressure Openings** (2) and select **Static Pressure**. Notice that the default static pressure value is 101325 Pa the static atmosphere pressure.
- Click 🖌.
- **5** Specify 2D XY plane flow analysis.

Answer: Do the following:

- In the Flow Simulation design tree, rightclick the Computational Domain item and select **Edit Definition**.
- Click **2D simulation** and select **XY plane**.
- Click 🖌.

It is known from hydrodynamics that channels with a sudden expansion generate hydraulic resistance to the flow due to a loss of flow energy caused by vortices in the vortex region downstream of the sudden expansion. Naturally, these regions add to the hydraulic resistance caused by the wall friction as well.

To consider the hydraulic resistance due to the sudden expansion only, let us replace in the calculations the channel's real walls by the "Ideal Walls" boundary condition option in SolidWorks Flow Simulation, which applies adiabatic frictionless walls. As a result, any wall friction will be absent (of course, this can be done in calculations only and it is impossible in physical experiments). The wall friction's influence on the generated vortices, and therefore on the sudden expansion hydraulic resistance, will be neglected for this analysis.

1 Specify the Ideal Wall boundary condition at the channel's walls.

Answer: Do the following:

- In the Flow Simulation design tree, right-click the Boundary Conditions item and select **Insert Boundary Condition**.
- Select six channel's walls shown colored in green.

- Under Type, click Wall and select Ideal Wall -----.
- Click 🖌.
- 2 Specify the Total Pressure and Dynamic Pressure surface goals at inlet.Answer: Do the following:
 - In the Flow Simulation Design tree, right-click the Goals icon and select **Insert Surface Goal**.
 - Click Inlet Velocity 1 item.
 - Under **Parameter**, find **Total Pressure** and **Dynamic Pressure** rows and check the **Av** column for the both.
 - Click 🖌.
- **3** Specify the Total Pressure surface goal at outlet.

Answer: Do the following:

- In the Flow Simulation Design tree, right-click the Goals icon and select **Insert Surface Goal**.
- Click Static Pressure 1 item.
- Under Parameter, find Total Pressure and check the Av column.
- Click 🖌.
- 4 Specify the Equation goal calculating the total hydraulic loss. Answer: Do the following:
 - In the Flow Simulation Design tree, right-click the Goals icon and select **Insert Equation Goal**.
 - Click the left bracket button [.
 - In the Goals list double-click the SG Av Total Pressure 1 goal name.
 - Click the minus button .
 - In the Goals list double-click the SG Av Total Pressure 2 goal name.
 - Click the right bracket) and the forward slash / buttons.
 - In the Goals list double-click the SG Av Dynamic Pressure 1 goal name.
 - In the **Dimensionality** list select **No units**.
 - Click OK.
- **5** Run the calculation.

Answer: Do the following:

- Click Flow Simulation, Solve, Run.
- Click **Run**. The solver starts.
- When calculation is finished, click File, Close in the Solver Monitor dialog box.

6 Plot the velocity distribution along the channel.

Answer: Do the following:

- Right-click the Cut Plots icon and select Insert.
- In the **Contours** dialog box under **Parameter**, select **Velocity**.
- Click **OK**.
- Click OK.

7 Obtain the hydraulic loss caused by the model's sudden expansion by viewing the equation goal average value.

Answer: Do the following:

- Right-click the Goals icon and select Insert.
- In the **Select Goals** list, select Equation Goal 1.
- Click **OK**. The goals1 Excel workbook is created.
- Switch to goals1 workbook and see the goal value.

Bilateral expansion channel.SLDPRT [Project 1]

Goal Name	Unit	Value	Averaged Value	Minimum Value	Maximum Value	Progress [%]	Use In Convergence	Delta	Criteria
Equation Goal 1	[[]	0.118613834	0.121170201	0.118613834	0.125840706	100	Yes	0.004592578	0.005576504

Lesson 1 Vocabulary Worksheet – Answer Key

Name	Class:	Date:
		Dute

Fill in the blanks with the proper words.

- 1 The fluid flow equations solved by SolidWorks Flow Simulation: <u>time-dependent</u> <u>Reynolds-averaged 3D Navier-Stokes equations employing the k-e turbulence model</u>
- 2 The method used for solving these equations with SolidWorks Flow Simulation: <u>finite</u> <u>volume method</u>
- 3 The method used for solving time-independent problems with SolidWorks Flow Simulation: <u>a steady-state method employing local time steps</u>
- 4 The process of subdividing the model into small pieces: meshing
- 5 Splitting mesh cells into smaller ones to better resolve a solid/fluid interface or solution behavior: <u>mesh refinement</u>
- 6 The feature that allows users to track the convergence of a flow parameter(s) in a SolidWorks Flow Simulation project: **goals**
- 7 The physical feature which must be selected in SolidWorks Flow Simulation to initiate temperature calculation in solids: <u>heat transfer in solids</u>
- 8 The physical feature which must be selected in SolidWorks Flow Simulation to obtain a time-dependent solution: <u>time dependent</u>
- **9** The physical feature which must be selected in SolidWorks Flow Simulation to calculate a flow with significant supersonic regions: <u>High Mach number flow</u>
- **10** The physical feature which must be selected in SolidWorks Flow Simulation to properly calculate a heat convection and/or mixing fluids in low-velocity flows not in weightlessness: gravitational effects
- 11 The physical feature which must be selected in SolidWorks Flow Simulation to fully suppress any flow turbulence in the computational domain: <u>laminar flow</u>
- 12 The SolidWorks Flow Simulation approach of specifying a distributed resistance to a fluid flow: **porous medium**
- 13 Liquids whose viscosity depends on flow velocity gradients: non-Newtonian liquids

Lesson 1 Quiz — Answer Key

Name: _____ Class: _____ Date:____

Directions: Answer each question by writing the correct answer or answers in the space provided.

1 What is the specific requirement in SolidWorks Flow Simulation for an internal analyses?

<u>Answer:</u> SolidWorks Flow Simulation internal problem requires that the models be fully closed.

- 2 What if the fluid used in my design is not defined in the Engineering Database? Answer: You can specify your own fluid in the Engineering Database.
- **3** What is the reason for specifying goals in a project?

<u>Answer:</u> Specifying goals as a physical parameter allows you to obtain more reliable results and ensure, that these parameter values convergence within the calculation.

4 Why is it important to specify the proper minimum gap size?

<u>Answer:</u> A properly specified minimum gap size governs the proper cell resolution for small flow passages which will help improve the accuracy of the results.

- 5 How does a user define a fluid exiting the model at static atmospheric pressure?Answer: Do the following:
 - In the Flow Simulation design tree, right-click the Boundary Conditions item and select Insert Boundary Condition.
 - Select the outlet opening face.
 - Under Basic set of boundary conditions, select Pressure openings.
 - Select Static Pressure.
 - Under the Settings tab, specify the Static pressure of 101325 Pa and click OK.
- 6 After obtaining the results you intend to recalculate after changing a boundary condition's value. Do you have to regenerate the computational mesh?Answer: No. It is not necessary, since the mesh does not change in this case.
- 7 Can you obtain intermediate results during the calculation?

<u>Answer:</u> Yes, during the calculation you can view section plots of the current results, monitor goal convergence and display minimum and maximum parameter values.

8 How do you load results?

<u>Answer:</u> Right-click the Results icon in the Flow Simulation design tree and select Load Results or click Flow Simulation, Results, Load/Unload Results.

9 You have specified a goal. How can you see the goal value after finishing the calculation?

<u>Answer:</u> To see the goal value after finishing the calculation you need to create a **Goal Plot**:

- Right-click the Goals icon in the Flow Simulation design tree and select **Insert**. The **Goals** dialog box appears.
- In the **Goals** dialog box, select the goal name and click **Add**.

- Click **OK**.
- **10** When can the symmetry condition be applied?

Answer: The symmetry condition can be applied if the flow is symmetric.

11 What causes hydraulic losses in a pipeline?

<u>Answer:</u> Hydraulic losses are caused by the friction and deformation of the flow stream (due to an obstacle, changing the flow passage, bends, etc.).

Lesson Summary

- □ SolidWorks Flow Simulation is a fluid flow and heat transfer analysis software fully integrated in SolidWorks.
- □ Analysis enables you to understand and improve the design by saving time and money by reducing the traditional design cycle.
- SolidWorks Flow Simulation allows you to analyze a wide range of complex problems in fluid mechanics and heat transfer: two- and three-dimensional analyses; external and internal flows; steady-state and transient flows; incompressible and compressible liquid flows; gas flows including subsonic, transonic and supersonic regimes; heat transfer within and between fluids and solids; non-Newtonian liquids (laminar only); laminar, turbulent, and transitional flows; swirling flows and fans; multi-species flows; flows with gravitational effects (also known as buoyancy effects); porous media; fluid flows with solid particles; walls with roughness; surface-to-surface radiation.
- □ Typical internal analyses, are defined by a fluid which enters a model at the model inlet(s) and exits the model through outlet(s).
- □ The steps to perform internal fluid flow analysis in SolidWorks Flow Simulation are:
 - Close the model with the lids at inlet and outlet openings.
 - Create a project.
 - Specify boundary conditions.
 - Specify goals.
 - Adjust geometry resolution if necessary.
 - Run the calculation.
 - Obtain the results.
- Goals are physical parameters of interest to the user. Setting goals is a way of conveying to SolidWorks Flow Simulation what you are trying to get out of the analysis, as well as a means of reducing the time SolidWorks Flow Simulation takes to reach a solution. Goals allow you to obtain more reliable results, since you can examine the convergence history of each goal value in the calculation.
- Computational domain is the area where the calculation is performed. Computational domain is divided into small rectangular volumes cells. This process is called meshing. The mesh cells are subdivided into smaller rectangular cells as necessary to properly resolve the model geometry and the flow features.
- □ The cell-centered finite volume (FV) method is used to obtain conservative approximations of the governing equations on the locally refined rectangular mesh.
